

# DATA FOLKZ

## NUMPY

# What is NumPy?

- Python is a fabulous language
  - Easy to extend
  - Great syntax which encourages easy to write and maintain code
  - Incredibly large standard-library and third-party tools
- No built-in multi-dimensional array (but it supports the needed syntax for extracting elements from one)
- NumPy provides a **fast** built-in object (ndarray) which is a multi-dimensional array of a homogeneous data-type.

# Overview of NumPy

## **N-D ARRAY (NDARRAY)**

- N-dimensional array of rectangular data
- Element of the array can be C-structure or simple data-type.
- Fast algorithms on machine data-types (int, float, etc.)
- Arrays are used to store multiple values in one single variable. Python does not have built-in support for Arrays, but Python lists can be used instead .

# NumPy Array

- A NumPy array is an N-dimensional homogeneous collection of “items” of the same “kind”. The kind can be any arbitrary structure and is specified using the data-type.

Command

```
np.array([1,2,3])
```

NumPy Array

|   |
|---|
| 1 |
| 2 |
| 3 |

# Dimensions in Arrays

1D array

axis 0 →

shape: (4,)

2D array

axis 0 ↓

axis 1 →

shape: (2, 3)

3D array

axis 0 ↓

axis 1 ↘

axis 2 ↗

shape: (4, 3, 2)

# Dimensions in Arrays

- **0-D Arrays** : 0-D arrays, or Scalars, are the elements in an array. Each value in an array is a 0-D array.

Input : `arr = np.array(42)`

Output : 42

- **1-D Arrays** : An array that has 0-D arrays as its elements is called uni-dimensional or 1-D array.

Input : `arr = np.array([1, 2, 3, 4, 5])`

Output: [1 2 3 4 5]

# Dimensions in Arrays

- **2-D Arrays** : An array that has 1-D arrays as its elements is called a 2-D array. These are often used to represent matrix or 2nd order tensors.

**Input** : `arr = np.array([[1, 2, 3], [4, 5, 6]])`

**Output** : `[[1 2 3]  
[4 5 6]]`

- **3-D arrays** : An array that has 2-D arrays (matrices) as its elements is called 3-D array. These are often used to represent a 3rd order tensor.

**Input** : `arr = np.array([[[1, 2, 3], [4, 5, 6]], [[1, 2, 3], [4, 5, 6]]])`

**Output** : `[[[1 2 3]  
[4 5 6]]  
[[1 2 3]  
[4 5 6]]]`

# Multi-Dimensional Arrays

An array can have any number of dimensions.  
When the array is created, you can define the number of dimensions by using the ndmin argument.

## MULTI-DIMENSIONAL ARRAYS

**Input :** `a = array([[ 0, 1, 2, 3],  
[10,11,12,13]])`

**Output :** `array([[ 0, 1, 2, 3],  
[10,11,12,13]])`

## (ROWS,COLUMNS)

**Input :** `a.shape`

**Output :** `(2, 4)`

## NUMBER OF DIMENSIONS

**Input :** `a.ndim`

**Output :** `2`

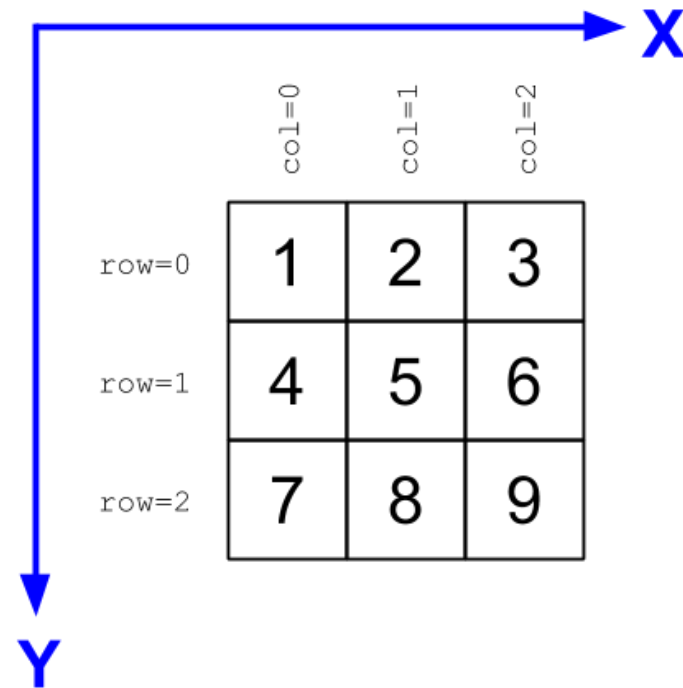

# Matrix In Python

- A Python matrix is a specialized two-dimensional rectangular array of data stored in rows and columns. The data in a matrix can be numbers, strings, expressions, symbols, etc. Matrix is one of the important data structures that can be used in mathematical and scientific calculations.
- $A = \begin{bmatrix} 1 & 4 & 5 \\ -5 & 8 & 9 \end{bmatrix}$

- Output :  $\begin{bmatrix} 1 & 4 & 5 \\ -5 & 8 & 9 \end{bmatrix}$

# Matrix Operation using Num py.Array()

- The matrix operation that can be done is addition, subtraction, multiplication, transpose, reading the rows, columns of a matrix, slicing the matrix, etc.

A 3x3 matrix is shown with row and column indices. The rows are labeled 'row=0', 'row=1', and 'row=2' on the left. The columns are labeled 'col=0', 'col=1', and 'col=2' on top. The matrix contains the following values:

|       | col=0 | col=1 | col=2 |
|-------|-------|-------|-------|
| row=0 | 1     | 2     | 3     |
| row=1 | 4     | 5     | 6     |
| row=2 | 7     | 8     | 9     |

A blue arrow labeled 'X' points to the right above the matrix. A blue arrow labeled 'Y' points downwards to the left of the matrix.

# Array Slicing

Slicing in python means taking elements from one given index to another given index. We pass slice instead of index like this: [start:end]

***SLICING WORKS MUCH LIKE STANDARD PYTHON SLICING :-***

**Input : a[0,3:5]**

**Output : array([3, 4])**

**Input : a[:,2]**

**Output :**

**array([2,12,22,32,42,52])**

| 0  | 1  | 2  | 3  | 4  | 5  |
|----|----|----|----|----|----|
| 10 | 11 | 12 | 13 | 14 | 15 |
| 20 | 21 | 22 | 23 | 24 | 25 |
| 30 | 31 | 32 | 33 | 34 | 35 |
| 40 | 41 | 42 | 43 | 44 | 45 |
| 50 | 51 | 52 | 53 | 54 | 55 |

# NumPy dtypes

[Click to add text](#)

| Basic Type       | Available NumPy types                        | Comments  |
|------------------|--|---|
| Boolean          | bool   | Elements are 1 byte in size   |
| Integer          | int8, int16, int32, int64, int128, int       | int defaults to the size of int in C for the platform   |
| Unsigned Integer | uint8, uint16, uint32, uint64, uint128, uint | uint defaults to the size of unsigned int in C for the platform   |
| Float            | float32, float64, float, longfloat,          | Float is always a double precision floating point value (64 bits). longfloat represents large precision floats. Its size is platform dependent. |
| Complex          | complex64, complex128, complex               | The real and complex elements of a complex64 are each represented by a single precision (32 bit) value for a total size of 64 bits.             |
| Strings          | str, unicode                                 | Unicode is always UTF32 (UCS4)  |
| Object           | object                                       | Represent items in array as Python objects.   |
| Records          | void   | Used for arbitrary data structures in record arrays.  |

# Statistics Array Methods

## MEAN

**Gives mean value of each column**

```
a = array([[1,2,3],  
          [4,5,6]], float)
```

Input : `mean(a, axis=0)`

Output : `array([ 2.5, 3.5, 4.5 ] )`

## STANDARD DEV./VARIANCE

### Standard Deviation

Input : `a.std(axis=0)`

Output : `array([ 1.5, 1.5, 1.5])`

### Variance :

Input : `a.var(axis=0)`

Output : `array([2.25, 2.25, 2.25])`

# Summary of (most) array attributes/methods

## BASIC ATTRIBUTES

- **a.dtype** – Numerical type of array elements. float32, uint8, etc.
- **a.shape** – Shape of the array. (m,n,o,...)
- **a.size** – Number of elements in entire array.
- **a.itemsize** – Number of bytes used by a single element in the array.
- **a.nbytes** – Number of bytes used by entire array (data only).
- **a.ndim** – Number of dimensions in the array.
- **a.T** – Shorthand for **a.transpose()**

# Summary of (most) array attributes/methods

## REDUCTION METHODS

All the following methods "reduce" the size of the array by 1 dimension by carrying out an operation along the specified axis. If axis is None, the operation is carried out across the entire array.

- `a.sum(axis=None)` - Sum up values along axis.
- `a.prod(axis=None)` - Find the product of all values along axis.
- `a.min(axis=None)` - Find the minimum value along axis.
- `a.max(axis=None)` - Find the maximum value along axis.
- `a.mean(axis=None)` - Find the mean (average) value along axis.
- `a.std(axis=None)` - Find the standard deviation along axis.
- `a.var(axis=None)` - Find the variance along axis.
- `a.any(axis=None)` - True if any value along axis is non-zero. (or)
- `a.all(axis=None)` - True if all values along axis are non-zero. (and)
